Abstract—The purpose of this study was to determine if there were differences in the prevalence of musculoskeletal disorders among different types of workers. The study included 600 male employees from a large manufacturing company who had been employed for at least one year. They were divided into three groups based on their job type: manual laborers, machine operators, and office workers. Data were collected through self-reported questionnaires and medical records. Results showed that manual laborers had the highest prevalence of musculoskeletal disorders, followed by machine operators, while office workers had the lowest prevalence.
